

Sales Performance Dashboard

Data Analytics Portfolio Project

Author:

RJ

Tools:

PostgreSQL, Power BI, Excel

This project demonstrates an end-to-end data analytics workflow. Raw sales data was imported, cleaned, analyzed using SQL, and transformed into an interactive Power BI dashboard. The objective was to evaluate sales performance, profitability, customer contribution, and target Achievement

Project Overview

Business Questions

- How much total sales and profit did the business generate?
- Which customers contributed the most revenue?
- Which categories performed best?
- Did monthly sales meet business targets?

Dataset

The project uses three related datasets: Orders, Order Details, and Sales Target. These tables were analyzed to create KPI metrics and business insights.

Data Preparation

- Imported CSV files into PostgreSQL
- Standardized date formats
- Validated numerical fields
- Created table relationships
- Prepared data for dashboard reporting

Technical Skills Demonstrated

SQL

SELECT, WHERE, GROUP BY, HAVING, CASE WHEN, JOIN, CTE, and Window Functions.

Power BI

Interactive dashboard creation, KPI cards, filters, trend analysis, target tracking, and business reporting.

Excel

Data validation, basic cleaning, and data preparation

Key Results

Total Sales: 431.5K

Total Profit: 23.9K

Total Orders: 500

Total Quantity Sold: 5,615

Key Insights

- Revenue was concentrated among a smaller group of high-value customers.
- Some products generated sales but reduced profitability.
- Monthly performance fluctuated across the reporting period.
- Target achievement varied by month and can be monitored through the dashboard.

Business Recommendations

- Focus on profitable products and categories.
- Improve retention of high-value customers.
- Monitor low-profit products for pricing or cost issues.
- Use dashboard insights to support business decisions
